

MAVRA learning and maintenance

1-2

learning

3-7

maintenance

other outcome

relearn

1 Learn

built-in agent (LLM)

question: March store revenue
SUM(ss_net_paid) ... d_moy = 3
answer 13,570,368.70, verified ✓
validated before publishing ✓

2 Publish v1

the definition holds

SUM(ss_net_paid)
rules: one row per sale,
date key unique,
loss in bound; learning SQL

3 New data

new sales appended

store_sales 12 → 13
rechecked: still holds ✓
other metrics: reuse ✓
stays v1

✗ No repair

e.g. a batch loaded twice

one row per sale: fails ✗
no filter restores it
retired; agents told
retired until relearned

4 Restatement

old rows kept as non-current

store_sales 13 → 14
one row per sale: fails ✗
v1 retired
unfixed: old rows counted

a later write

5 Find a repair

try filters on few-value columns

ss_is_current='1' ✓
ss_is_current='0' loses sales ✗
exactly one works ✓

6 Regression test

rerun March on learning-time data

learning SQL 13,570,368.70
with the filter 13,570,368.70
same: fix accepted ✓
current data would refuse it

7 Publish v2

new version, same metric

v2 = v1 + filter
ss_is_current='1'
SQL naming v1: rejected
waiting requests get v2

none (or several) work
